Spatial Filtering

CSC 391: Introduction to Computer Vision

Spatial filtering

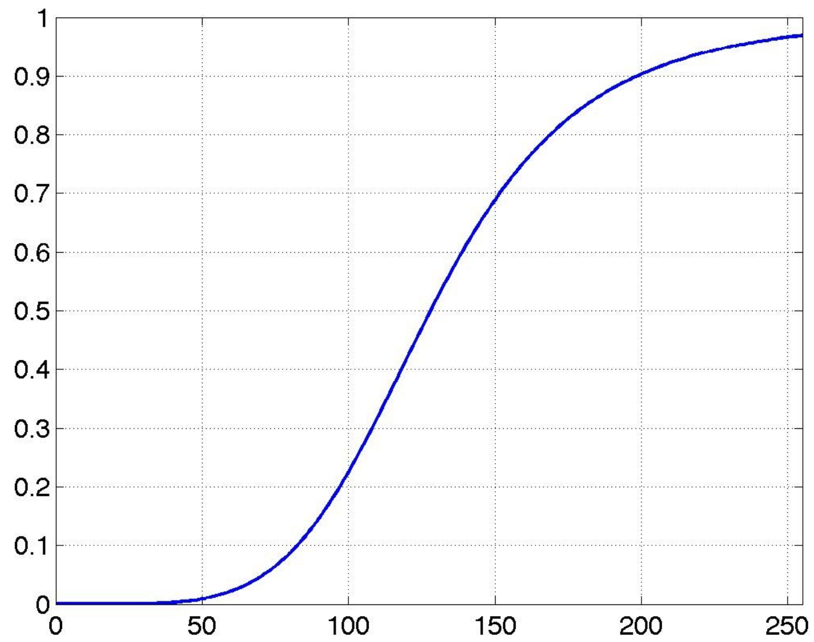
- A function operating on the intensity of an image

$$\underbrace{g(\boldsymbol{x})}_{\text{output image}} = \underbrace{h}_{\text{filter}}(\underbrace{f(\boldsymbol{x})}_{\text{input image}})$$

- Applications
    - Image enhancement, contrast manipulation, denoising, blurring, edge detection, detecting patterns, etc.

Point-wise operation: Contrast stretching

- Assume image f with intensity range 0 - 255
  - Transformation function: $$g = h(f) = \frac{1}{1 + (m/f)^E}$$



m = 128, E=5

Linear filtering

$$g(i,j) = \sum_{k=1}^{3} \sum_{\ell=1}^{3} f(i+k-2, j+\ell-2)h(k,\ell)$$

- filter: h (3 x 3)
- input image: f
- resulting image: g

Box filter

$$h(\cdot,\cdot)$$

$$\frac{1}{9}\begin{array}{|c|c|c|}\hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array}$$

Box Filter

What does it do?

- Replaces each pixel with an average of its neighborhood
- Achieve smoothing effect (remove sharp features)

$$h(\cdot, \cdot)$$

$$\frac{1}{9}\begin{array}{|c|c|c|}\hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array}$$

Key properties of linear filters

Linearity:

`filter(a*f_1 + b*f_2) = a*filter(f_1) + b*filter(f_2)`

$$\text{filter}(a*f_1 + b*f_2) = a*\text{filter}(f_1) + b*\text{filter}(f_2)$$

Any linear operator can be represented by matrix-vector multiplication

Shift invariance:

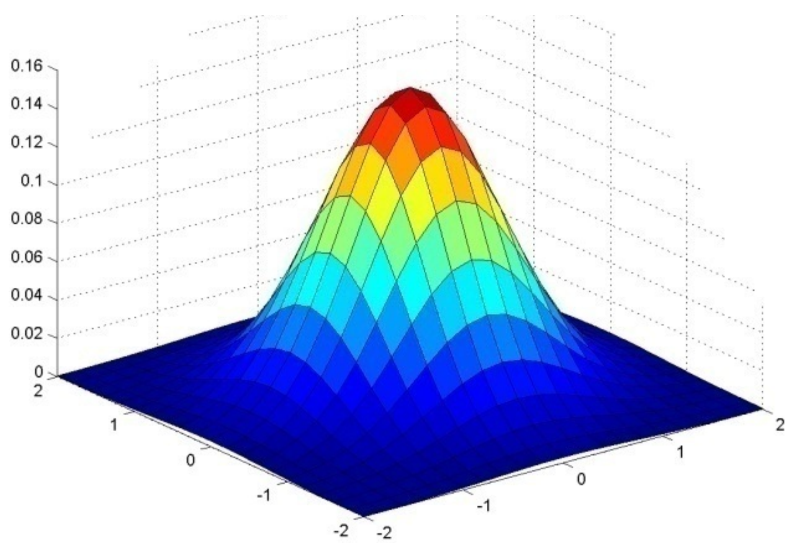
If `filter(shift(f)) == shift(filter(f))`

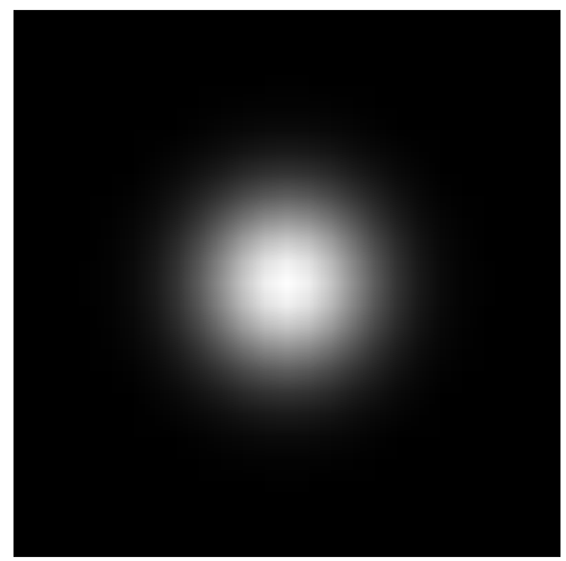
Any linear, shift-invariant operator can be represented as a convolution

Source: S. Lazebnik

Gaussian filters

- Weight contributions of neighboring pixels by nearness





0.003	0.013	0.022	0.013	0.003
0.013	0.059	0.097	0.059	0.013

0.013	0.059	0.097	0.059	0.013
0.003	0.013	0.022	0.013	0.003

5 x 5, $\sigma = 1$

$$G_\sigma = \frac{1}{2\pi\sigma^2} e^{-\frac{(x^2+y^2)}{2\sigma^2}}$$

```
>> [X,Y] = meshgrid([-2:2],[-2:2]);
>> sigma = 1;
>> G = 1/(2*pi*sigma^2) * exp(-(X.^2 + Y.^2)/(2*sigma^2));
```

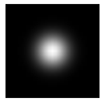
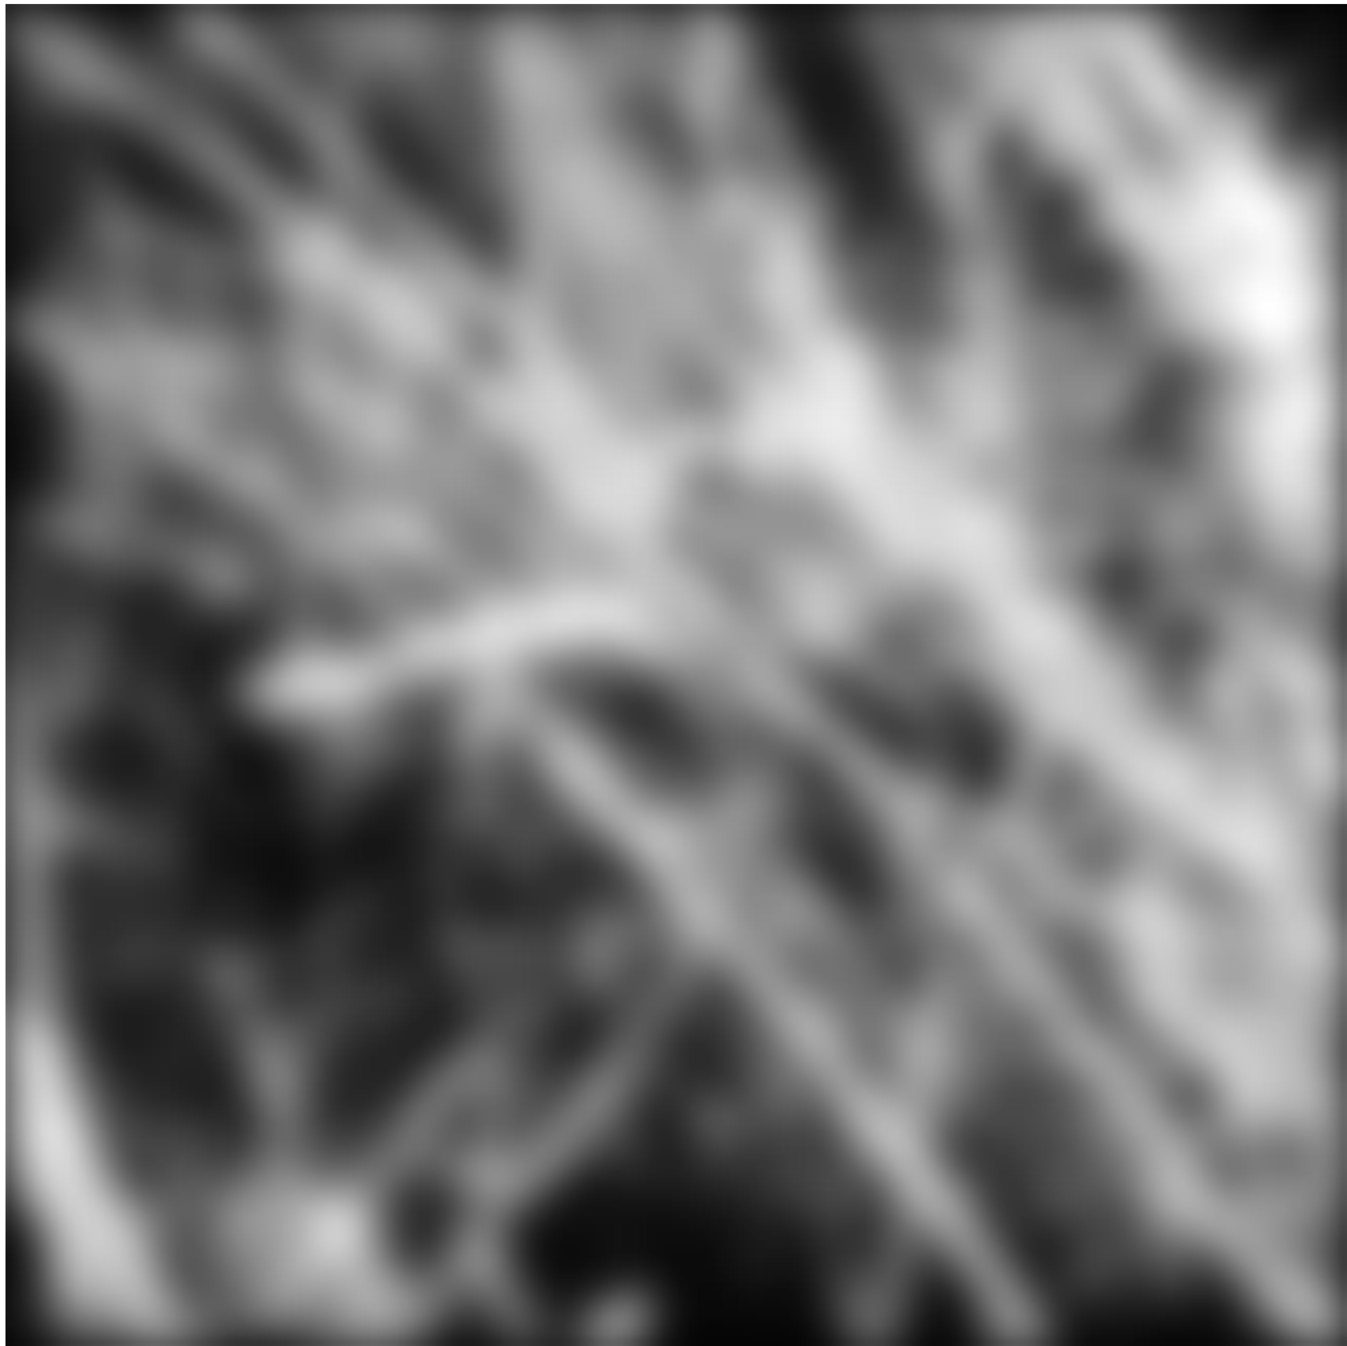
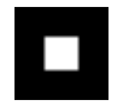
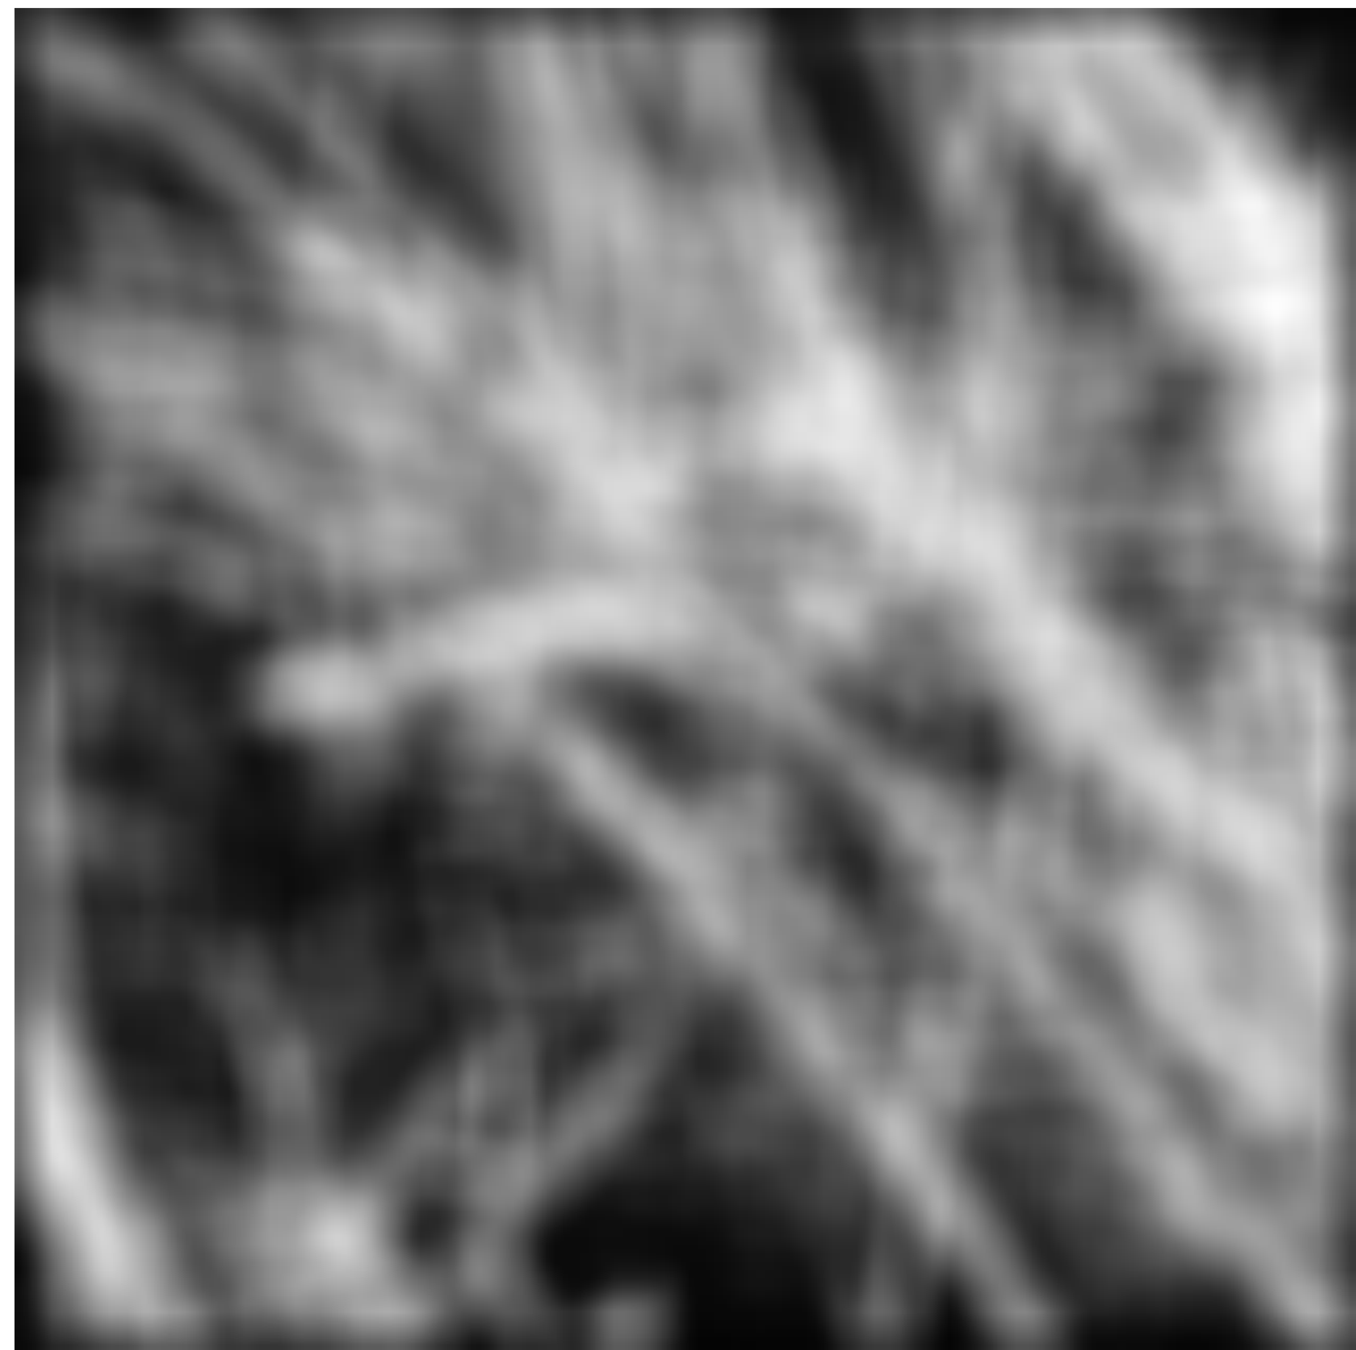
Smoothing with Gaussian filter





Smoothing with box filter





Practical considerations

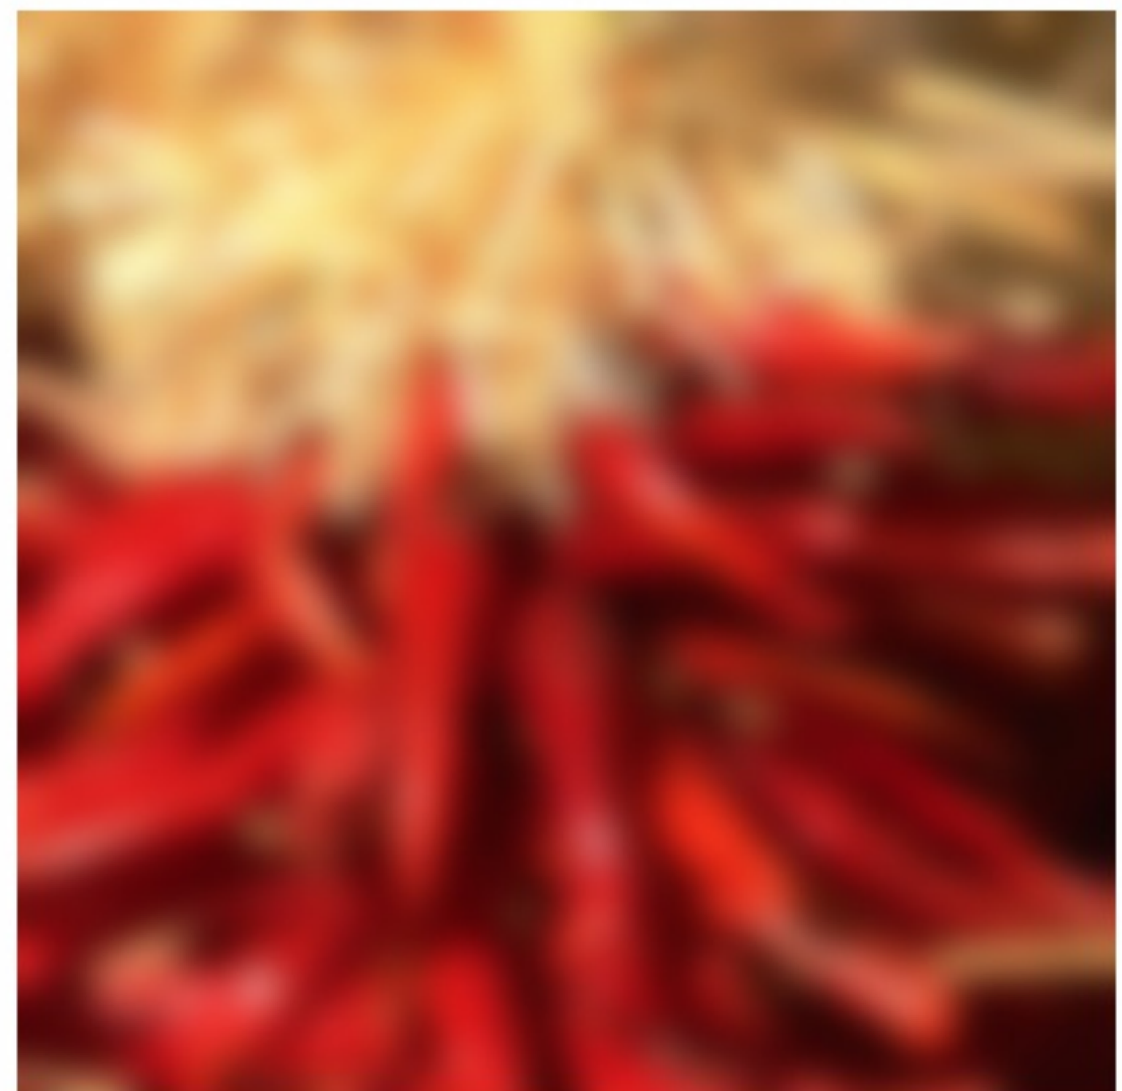
How big should the filter be?

- Values at edges should be near zero
- Rule of thumb for Gaussian: set filter half-width to about 3 σ

Source: J. Hays

Practical considerations

- What about near the edge of the image?
  - the filter window falls off the edge of the image
  - need to extrapolate
  - methods:
    - clip filter (black)
    - wrap around
    - copy edge
    - reflect across edge



Source: S. Marschner

Median filters

- Nonlinear filter

- A **Median Filter** operates over a window by selecting the median intensity in the window.
- What advantage does a median filter have over a mean filter?
- Is a median filter a kind of convolution?
